

**Vibration Resistant**

**Vibration Resistant Longlife**

**LAMPS' END**

The life of a lamp bulb can end for various reasons:

1. The globe is broken
2. The filament is broken
3. The filament is burned out

While we can't prevent case 1 from happening, we can significantly reduce the probability of case 2 and 3.

The reason for the filament to break is in most cases heavy vibration of vehicles moving under rough conditions; for example on bad roads or even off road. Within our bulbs called HD (Heavy Duty) or VR (Vibration Resistant) the geometry has been slightly changed so that filament vibration is reduced and filament lifespan is increased.

Bulbs burn out because the filament is used up by simply glowing. In FLÖSSER bulbs designated LL (Long Life) the burn out process is slowed down by using a different gas mixture compared to standard bulbs.

By installing FLÖSSER bulbs with the label VR LL you have the advantage of both. Using VR LL bulbs ensures optimal performance and maximum lifespan.
